ADVANTAGE DESIGN CONSTRUCTION
LAFAYETTE, LOUISIANA — WWW.ADC3K.COM

MARLIE II

LAFAYETTE INFRASTRUCTURE PARTNERSHIP — H2 2026

Louisiana's first **Vera Rubin–class AI factory** — built on Lafayette ground, powered by Lafayette gas, connected by **LUS Fiber**, and operated by a Lafayette-licensed general contractor. This is not a company coming in from outside. This is Lafayette building its own AI infrastructure — and inviting its utility partners to be part of it from day one. **Shovel-ready. Federally eligible. Act 730 qualified. H2 2026.**

- NVIDIA RUBIN — H2 2026
- NATURAL GAS POWERED
- LUS FIBER CONNECTED
- FEDERAL FUNDING ELIGIBLE
- LA ACT 730 — 20YR TAX EXEMPT
- FEMA ZONE X — HIGH GROUND
- AIRPORT ADJACENT — PART 107 UAS
- GC PERMITS READY — 6 MO DEPLOY

POWER STRATEGY

OFF GRID BY DESIGN

NATURAL GAS — PRIMARY POWER — NOT BACKUP

Marlie I is **not connected to the utility grid**. That is not a limitation — it is the strategy. On-site natural gas generation provides 100% of compute power, eliminating grid dependency, rate volatility, and capacity constraints. **Henry Hub** — the world's most liquid natural gas benchmark — sits **40 miles away in Erath, LA**, locking Marlie I's fuel costs to the most competitive gas price on earth. We push to LUS Fiber for connectivity, Atmos Energy for gas supply, and **NVIDIA Texas factories for hardware** — on our terms, on our timeline. **We are not on the grid. We are bringing our own.**

100%	40mi	0
ON-SITE GENERATION	HENRY HUB GAS BENCHMARK	GRID DEPENDENCY

01 — INVESTMENT THESIS

01

Skip Blackwell. Deploy Rubin.

The market is building data centers around **Blackwell** — last generation's answer. Marlie I is designed from the ground up for **NVIDIA Vera Rubin**, shipping H2 2026. Rubin delivers **2.5x the FP4 compute density** of GB200 NVL72 (3.6 vs 1.44 ExaFLOPS per rack), 22 TB/s HBM4 memory bandwidth per GPU, and 24x faster rack deployment. Investors who move now own the next generation of inference infrastructure — not a commodity rack of yesterday's hardware.

02

Infrastructure Already Exists

1201 SE Evangeline Thruway is not a greenfield project. ADC3K already owns the building. LUS Fiber runs 0.8 miles away. The LUS power substation is 1 mile out. Natural gas access via Atmos Energy is 3 miles. The **property carries only $15K in total debt**. Site prep, permits, and GC licensing are in hand. We are not buying land and hoping. We are converting an existing, debt-free asset into a revenue-generating AI factory.

03

Money Is Already Flowing

The **One Big Beautiful Bill Act** allocates $500B toward domestic AI infrastructure. Louisiana's **Act 730** provides a 20-year state and local tax exemption on qualifying manufacturing equipment. The **BEAD Broadband Program** and Gulf OCS Revenue sharing add further federal pathways. Marlie I is positioned at the intersection of every major capital flow into domestic AI — **100% US ownership, Texas-manufactured NVIDIA hardware, Louisiana-licensed GC**. The funding is not hypothetical. We qualify.

2.5x FP4 COMPUTE DENSITY VS GB200 NVL72	**6mo** ESTIMATED DEPLOY TIMELINE	**$15K** TOTAL PROPERTY DEBT
20yr LA TAX EXEMPTION ON EQUIPMENT	**#1** LOUISIANA INDUSTRIAL POWER RATES — USA	

02 — GOVERNMENT FUNDING STACK — FEDERAL + STATE + LOCAL

FEDERAL

ONE BIG BEAUTIFUL BILL ACT

Signed July 4, 2025, the OBBBA creates the most favorable federal policy environment for domestic AI infrastructure in US history. It codifies **FEOC (Foreign Entity of Concern) restrictions** — any project with Chinese, Russian, Iranian, or North Korean supply chain involvement is disqualified from federal tax credits, grants, and incentives. Marlie I is purpose-built for full compliance: **NVIDIA hardware manufactured in Texas** (Foxconn Houston, Wistron Fort Worth), 100% US ownership, Louisiana-licensed GC. The OBBBA also added **$500M to the BEAD broadband program** and raised Gulf OCS revenue sharing to **$650M/year** — both of which directly benefit Louisiana AI infrastructure. The $500B Stargate public-private AI program runs parallel to the OBBBA; Marlie I's FEOC-clean structure qualifies it for Stargate-aligned federal procurement and financing channels.

FEDERAL

BEAD BROADBAND PROGRAM

The **Broadband Equity, Access, and Deployment (BEAD) Program** distributes federal funding to expand broadband infrastructure in underserved areas. Lafayette sits within a region with significant BEAD allocation. AI factories require massive bandwidth — and the presence of **LUS Fiber**, a city-owned gigabit network, creates a unique opportunity to layer BEAD-funded backhaul expansion directly into the Marlie I connectivity plan. **LUS Fiber runs 0.8 miles from the site**. Direct fiber connection to the AI factory accelerates BEAD project eligibility for the City of Lafayette while simultaneously solving Marlie I's connectivity requirements.

FEDERAL

GULF OCS REVENUE

The OBBBA raised Louisiana's annual Gulf of America OCS revenue-sharing cap from **$500M to $650M/year through 2034** — a 30% increase in the state's offshore energy dividend. Louisiana's share (~$200M/year at cap) funds the Coastal Master Plan, the infrastructure backbone that protects sites like Marlie I from long-term flood risk. Simultaneously, Louisiana's offshore energy production — the same natural gas supply chain feeding Marlie I's generators — is the economic engine behind this revenue. **Henry Hub, the world's most liquid natural gas trading point, is 40 miles from Marlie I** in Erath, LA. Marlie I's fuel costs are benchmarked to the most competitive gas price on earth.

STATE

LOUISIANA ACT 730

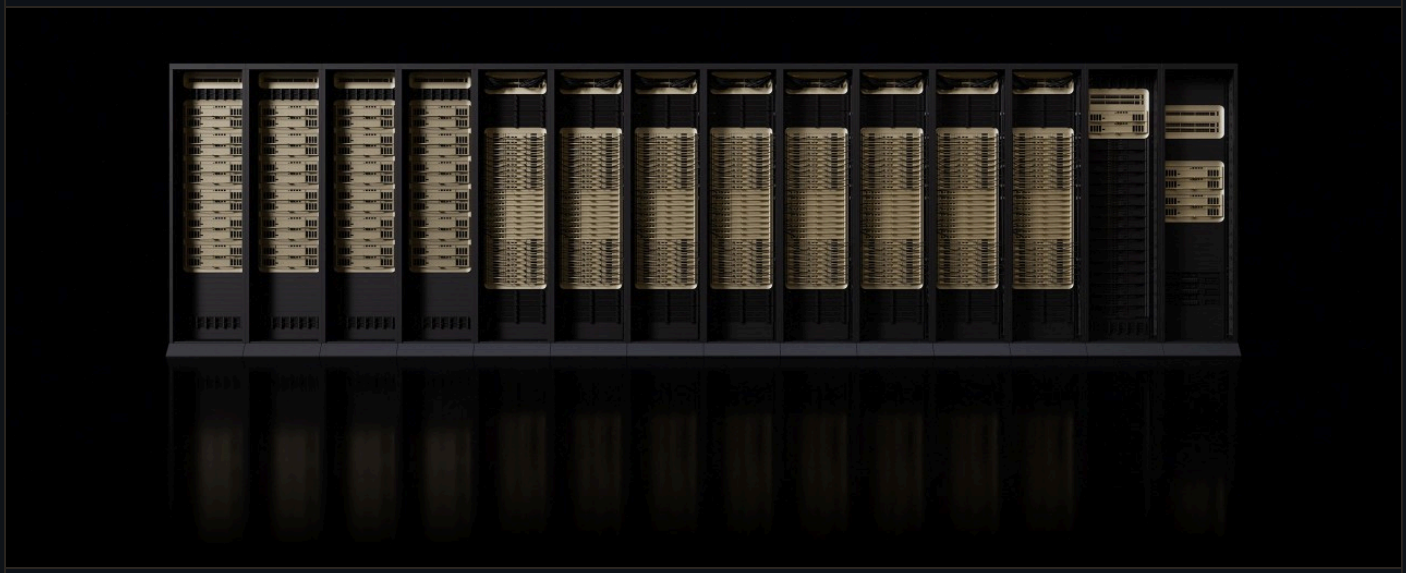
Louisiana Act 730 (effective July 1, 2024) provides a **20-year state and local sales and use tax rebate** on qualifying AI factory equipment, software, construction materials, and installation — with a 10-year renewal option (30 years total). Qualification requires **$200M+ in capital investment** and **50+ new permanent jobs** certified by Louisiana Economic Development. Marlie I's capital plan is structured to meet both thresholds. Once certified, a **Direct Payment Number** eliminates tax liability on the single largest cost in the project: GPU hardware. Stackable with the **Quality Jobs Program** (6% payroll rebate, 10 years) and **LED FastStart** (free customized workforce training). Combined with Louisiana's **#1-ranked industrial electricity rates**, Act 730 makes Marlie I's per-token economics unbeatable.

ADC3K COMPLIANCE NOTE

Federal funding under the OBBBA requires strict domestic content and zero involvement by prohibited foreign entities. Marlie I is purpose-built for compliance — NVIDIA hardware manufactured in Texas (Foxconn Houston, Wistron Fort Worth), 100% US ownership, US-licensed general contractor. We are not just eligible — we are the ideal candidate.

Six Chips. / One AI Supercomputer. / H2 2026.

NVIDIA NVL72 — VERA RUBIN AI SUPERCOMPUTER POD CES 2026 — OFFICIAL NVIDIA IMAGE



NVL72 rack system — 72 Rubin GPUs + 36 Vera CPUs — 100% liquid cooled — 3.6 ExaFLOPS NVFP4 inference per rack

NVIDIA Vera Rubin is not an incremental upgrade. It is a complete ground-up redesign of what an AI factory can do — and Jensen Huang said it plainly at GTC 2025: *"Rubin arrives at exactly the right moment... Rubin takes a giant leap toward the next frontier of AI."* Sam Altman agreed: *"Intelligence scales with compute... The NVIDIA Rubin platform helps us keep scaling this progress."* These are not marketing statements. They are the two most powerful people in AI describing what Marlie I is built to deploy.

Where Blackwell pushed the limits of existing silicon, Rubin rethinks the entire stack — CPU, GPU, switch fabric, networking, security, and cooling — as a single coherent system. One NVL72 rack delivers **3.6 ExaFLOPS of NVFP4 inference** from 72 Rubin GPUs and 36 Vera CPUs, all liquid cooled, all NVLink-connected, all shipping as a factory-integrated unit. It trains the same frontier models with **4x fewer GPUs** at **2.5x the FP4 compute density** of the prior generation. Scale to 14 racks — one DGX SuperPOD — and you have **50.4 ExaFLOPS** with **260 TB/s of NVLink bandwidth** connecting the entire cluster.

Every component is **manufactured in Texas** — within a 4-hour drive of Lafayette. Foxconn's Houston plant and Wistron's Fort Worth facility handle final assembly. Each NVL72 ships fully integrated: liquid cooling manifolds pre-installed, NVLink fabric pre-configured, ConnectX-9 NICs cabled. From factory floor to first token: **5 minutes of rack installation** versus the 1.5-hour process

of prior-generation systems. That is 18x faster deployment — and it means Marlie I starts generating revenue the day the rack arrives.

JENSEN HUANG — CEO, NVIDIA

"Rubin arrives at exactly the right moment... Rubin takes a giant leap toward the next frontier of AI."

SAM ALTMAN — CEO, OPENAI

"Intelligence scales with compute... The NVIDIA Rubin platform helps us keep scaling this progress."

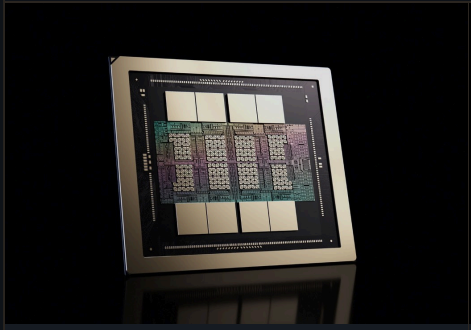
TO MARLIE I

Each NVL72 ships as a **fully integrated system** — 72 Rubin GPUs, 36 Vera CPUs, NVLink 6 switch fabric, ConnectX-9 SuperNICs, BlueField-4 DPUs, and liquid cooling manifolds pre-installed at the Texas factory. ADC3K deploys it. **No third-party integrator. No markup. No delay.** Marlie I's 7 NVIDIA certifications and Louisiana GC license mean we receive, rack, and power on. Revenue from day one.

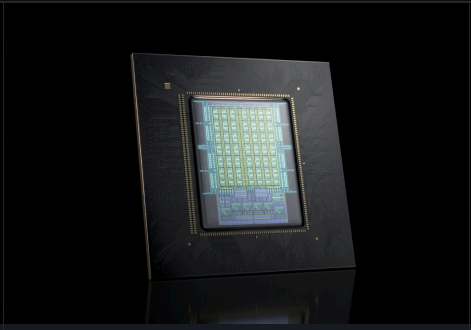
SIX CHIPS — ONE AI SUPERCOMPUTER

OFFICIAL NVIDIA PRODUCT RENDERS — VERA-RUBIN-NVL72



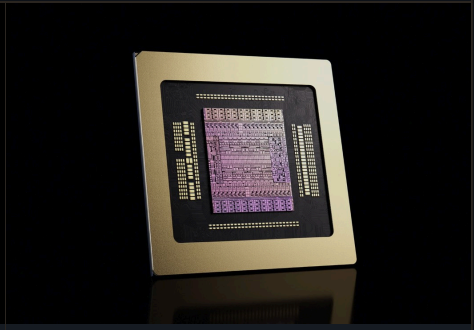
RUBIN GPU

288 GB HBM4 — 22 TB/s memory bandwidth. The inference engine at the core of every NVL72 rack. 72 per rack.



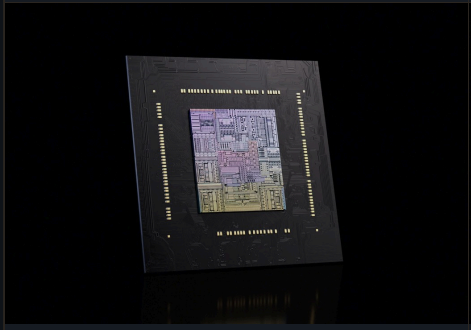
VERA CPU

88 custom Olympus cores. Replaces x86 entirely for AI workload orchestration. 36 per rack, paired with Rubin GPUs.



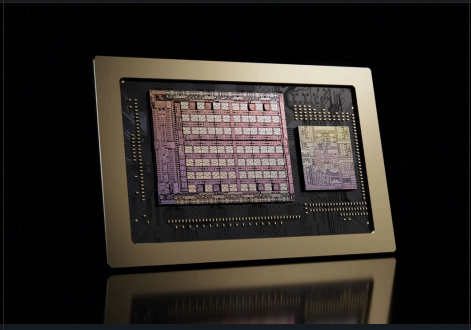
NVLINK 6 SWITCH

3.6 TB/s per-GPU bidirectional NVLink bandwidth. 260 TB/s aggregate within a single NVL72 rack. PCIe is not in this equation.



CONNECTX-9 SUPERNIC

1.6 Tb/s aggregate per GPU. AI traffic between nodes, racks, and storage — zero CPU involvement.



BLUEFIELD-4 DPU

Security and infrastructure at line rate. Encryption, firewall, storage I/O offloaded — GPU cycles go to inference only.

SPECTRUM-X ETHERNET

800G per port — co-packaged optics. Scale-out factory fabric built for AI east-west traffic at rack scale.

VERA RUBIN VS PRIOR GENERATION — PERFORMANCE COMPARISON

FP4 compute density vs GB200 NVL72	2.5x (3.6 vs 1.44 ExaFLOPS/rack)
HBM4 memory per GPU	288 GB — 20.7 TB total per rack
NVLink 6 per-GPU bandwidth	3.6 TB/s bidirectional

NVLink 6 aggregate per NVL72 rack	260 TB/s (intra-rack)
Memory per GPU	288 GB HBM4
Memory bandwidth per GPU	22 TB/s
Inference compute per rack (NVFP4)	3.6 ExaFLOPS
SuperPOD compute (14 racks)	50.4 ExaFLOPS
Cooling architecture	100% liquid — zero air cooling
Rack deployment time	5 min (18x faster than prior gen)
Production status	FULL PRODUCTION
Availability	H2 2026
TX factory distance to Marlie I	~4 hours

5 FACTS INVESTORS NEED TO KNOW ABOUT RUBIN

01 **First rack-scale confidential computing.** Rubin is the first AI platform to deliver hardware-level confidential computing at rack scale — unlocking healthcare, finance, and government workloads that Blackwell cannot legally touch.

02 **18x faster deployment.** NVL72 racks install in 5 minutes vs 1.5 hours for prior generation. Marlie I starts generating revenue the day the rack arrives.

03 **50.4 ExaFLOPS from 14 racks.** One DGX SuperPOD configuration. That is the compute equivalent of what used to require entire data center buildings — in 14 racks, liquid cooled, on Marlie I's floor.

04 **260 TB/s NVLink aggregate — per rack.** Every one of 72 Rubin GPUs inside a single NVL72 rack communicates at an aggregate 260 TB/s via NVLink 6. Scale-out across racks uses InfiniBand NDR. The interconnect is no longer the bottleneck. The model is.

05 **Full production — H2 2026.** Rubin is not a roadmap slide. It is in full production at Texas factories 4 hours from Lafayette. The investors who are at the table now own the first Rubin-class AI factory in Louisiana.

Self-Powered + Grid Feed

Marlie I is designed for **energy independence**. Natural gas generation provides on-site primary power, eliminating grid dependency for compute loads. Excess generation capacity feeds back to the LUS grid, creating a revenue stream and strengthening the site's relationship with city utilities. AI factories live or die on power availability — Marlie I owns its power stack.

ENERGY INDEPENDENT

EV Charging Substation

Phase 2 expansion includes a **commercial EV charging substation** on-site. Lafayette's proximity to I-10 and US-90 makes the location ideal for fleet charging infrastructure. The substation leverages existing power capacity from the natural gas generation system, adding a high-margin ancillary revenue stream without additional land acquisition.

PHASE 2 EXPANSION

Airport Adjacent — Part 107 UAS

Marlie I sits **adjacent to Lafayette Regional Airport (LFT)**. ADC3K holds a **FAA Part 107 Remote Pilot Certificate**, enabling commercial UAS operations from the site. Drone-based infrastructure inspection, aerial survey, and last-mile logistics represent near-term revenue opportunities that leverage the site's location and existing certifications — no additional real estate required.

UAS / DRONE READY

Physical Security — Built In

AI factory physical security is not an afterthought at Marlie I — it is part of the original buildout design. Perimeter hardening, access control, and **24/7 monitoring infrastructure** are included in Phase 1 construction scope. Colocation and managed inference customers require SOC 2-equivalent physical controls. Marlie I meets that bar from day one, enabling premium-tier customer contracts without post-hoc security retrofits.

SECURED FACILITY

Hub & Spoke — Louisiana Network

Marlie I is designed as the **hub of a Louisiana AI network**. Spoke facilities in Baton Rouge, New Orleans, and Lake Charles extend inference capacity to enterprise customers across the state. LUS Fiber and existing Louisiana broadband infrastructure provide the backbone. This hub-and-spoke model scales revenue without proportional capital expenditure — each spoke builds on Marlie I's existing operations team, software stack, and customer relationships.

SCALABLE NETWORK

LUS Fiber — City-Owned Network

LUS Fiber is one of the few municipal gigabit networks in the United States — owned and operated by the City of Lafayette. At 0.8 miles from Marlie I, it represents a direct, low-latency fiber connection to city infrastructure, state government networks, and regional enterprise customers. City ownership means **no incumbent telco gatekeeping**, competitive pricing, and a natural public-private partnership pathway for Marlie I's connectivity buildout.

DIRECT FIBER CONNECTION

05 — SITE & INFRASTRUCTURE — 1201 SE EVANGELINE THRUWAY

OWNER-BUILT INFRASTRUCTURE

Scott Tomsu designed and built this building himself, 20 years ago. Exterior footprint: **24 ft × 40 ft**. Interior working floor: **22 ft × 35 ft — 770 sq ft of Phase 1 compute space**, plus a full second floor and the adjoining property. The ceiling is **2×12 framing with two layers of 5/8″ Type X sheetrock** — a UL-rated fire assembly, built that way from day one because the shop was originally a motorcycle garage. Heavy insulation throughout creates thermal stability ideal for optimizing liquid cooling airflow between rack cabinets and rails. It has survived multiple direct Gulf hurricane impacts with zero structural damage. Reinforced slab foundation. Built on high ground in the Lafayette city core — above regional base flood elevation, in FEMA Zone X. This is not a leased warehouse or a speculative build. It is a proven, battle-tested structure on owned land, built by the same hands that will deploy the AI factory inside it. **The GC license, the building, and the certifications are all one team.**

MARLIE I — TWO-FLOOR PLAN — 36 × 22 FT PER FLOOR — 32 NVL72 RACKS TOTAL (FLOOR 1 SHOWN)

LIQUID COOLING RACK LAYOUT — TWO FLOORS

MARLIE I occupies a **two-story structure** with a 40×24 ft OD footprint. Each floor delivers **36×22 ft of usable compute space** — beams and structure account for the 2 ft differential from OD. A single 4×22 ft staircase opening at the east end connects both floors, placing the stairwell in one corner and leaving the full rack field unobstructed on both levels.

Floor 1 (Ground): Rows A & B — 16 NVL72 racks (A1–A8, B1–B8). Full hot aisle / cold aisle containment, CDU units at each end of the hot aisle, exterior dry coolers and generators at south face.
Floor 2 (Upper): Rows C & D — 16 NVL72 racks (C1–C8, D1–D8). Identical layout directly above Floor 1. Drop ceiling installed — standard liquid cooling manifolds run the same architecture. Wiring paths run freely through the shell. The floor is already down, structural load rating confirmed.

The building's existing drop ceiling on Floor 2 is an advantage — **conduit, manifold lines, and cable trays run clean above the drop plane**, no additional structural build-out required. Same CDU architecture, same Bloom Energy feed, same fiber entry point. Both floors commission off the same utility plant.

Two floors. One footprint. One utility plant. Double the compute.

SCALABILITY — THREE EXPANSION VECTORS

Floor 1 (Ground): 36×22 ft — 16 NVL72 racks (A1–A8, B1–B8) — 57.6 ExaFLOPS — 1,152 GPUs.
Floor 2 (Upper): 36×22 ft — 16 NVL72 racks (C1–C8, D1–D8) — identical layout, staircase at east end — 1,152 GPUs.
Full Build: 32 NVL72 racks — 2,304 GPUs — 115.2 ExaFLOPS — one footprint, one utility plant, double the compute.
Phase 3: Adjacent owned property — horizontal campus buildout when both floors are at capacity.
Two floors. One footprint. No land acquisition needed to double compute.

06 — WHY ADVANTAGE DESIGN CONSTRUCTION

LICENSED GENERAL CONTRACTOR

ADC3K holds an active **Louisiana General Contractor license**. This is not a paper credential — it means Scott Tomsu can pull permits, hire trades, and legally execute the Marlie I buildout without a third-party GC. That eliminates a **10–15% GC markup** on construction costs and keeps the entire project under a single point of accountability. For investors, this means fewer middlemen, tighter cost control, and faster decision-making on the job site.

7 NVIDIA CERTIFICATIONS

ADC3K holds **7 active NVIDIA certifications** — covering AI infrastructure design, GPU compute deployment, and NVIDIA partner program requirements. These certifications unlock access to NVIDIA's partner ecosystem, preferred pricing channels, and technical pre-sales support for enterprise customers. They also satisfy a key eligibility requirement for federal procurement under AI infrastructure programs that mandate certified implementation partners.

FAA PRIVATE PILOT + PART 107

Scott Tomsu holds an **FAA Private Pilot Certificate** and a **Part 107 Remote Pilot Certificate**. These certifications enable commercial UAS operations from the Marlie I site — adjacent to Lafayette Regional Airport (LFT). Drone-based infrastructure inspection, aerial site documentation, and contract UAS services represent immediate revenue opportunities that require no additional real estate and leverage existing certifications.

ENERGY INDEPENDENCE STRATEGY

Marlie I's on-site **natural gas generation** is not a backup plan — it is the primary power strategy. AI factories require guaranteed uptime and predictable energy costs. Grid dependency introduces both variables. ADC3K's energy design eliminates grid dependency for compute loads, locks in fuel costs via fixed-rate Atmos Energy contracts, and creates a grid feed revenue stream from excess generation. **Louisiana's #1-ranked industrial power rates** make the base case economics exceptional; energy independence makes them unbreakable.

OBBBA + ACT 730 QUALIFIED

Marlie I does not merely hope to qualify for federal and state incentives — it was **designed around them**. 100% US ownership, Texas-manufactured NVIDIA hardware, Louisiana-licensed GC execution, and zero foreign entity involvement satisfy every OBBBA domestic content requirement. Louisiana Act 730's **20-year equipment tax exemption** is the largest single capital benefit available to any AI factory operator in the state. ADC3K has the legal structure, hardware sourcing, and operational model to capture both programs from day one.

COMPTIA A+ & NETWORK+

CompTIA A+ and **CompTIA Network+** certifications, earned in the late 1990s when IT infrastructure was hand-built from the ground up. These are the foundational credentials that every serious AI infrastructure engineer starts with. Scott Tomsu has been building, configuring, and running networked systems since before most of today's AI companies existed. The learning curve that stops other operators **does not exist here**.

ALL SEVEN LAYERS — NOT JUST ONE

Most AI infrastructure proposals come from one discipline: finance, construction, or IT. Scott Tomsu operates across **every layer simultaneously**. Fusion 360 CAD/CAM design and CNC programming on Centroid-controlled machines — the same precision toolpathing and tolerance discipline that governs rack enclosure fabrication. Automotive and motorcycle ECM tuning — mapping fuel, ignition, and sensor tables on engine control modules — is applied electronics at the systems level: reading sensor inputs, calibrating thresholds, diagnosing faults across interconnected subsystems. That is exactly what a data center operations engineer does every day. Add 20 years of ROV underwater robotics, a GC license, 7 NVIDIA certifications, a Private Pilot certificate, and a working AI multi-agent platform built from scratch — and you have an operator who can have a peer-level conversation with your network architect, your mechanical engineer, your power systems contractor, and your NVIDIA field rep **in the same meeting**. That depth of cross-layer fluency does not exist at other AI factory proposals in this market. **This one was built by the same hands that will run it.**

20 YEARS — UNDERWATER ROBOTICS

Two decades of **ROV (Remotely Operated Vehicle)** and underwater robotics work in the Gulf of Mexico oil and gas industry. Systems that operate at depth, under pressure, in hostile environments — with absolute zero tolerance for failure. AI factory operations demand the same discipline: **continuous uptime, redundant systems, immediate fault response**. Scott brings field-hardened systems thinking to an industry where most operators come from finance.

LOUISIANA MOMENTUM

Louisiana is winning the AI infrastructure race. **Hut 8's $10B River Bend campus** (West Feliciana Parish) — backed by a $7B Google-guaranteed lease with Fluidstack — proved the state's competitive package. **First Solar's $1.1B solar factory** opened in Iberia Parish (20 miles from Marlie I) in July 2025: 3.5 GW/year, 700+ jobs, FEOC-compliant. **Meta ($27B) and Amazon ($12B)** chose Louisiana in the last 18 months. ADC3K is first to Lafayette — the energy capital of Acadiana — with a site that is shovel-ready today. No out-of-state operator can replicate local GC licensing, city relationships, and an owned, debt-free property in the heart of Lafayette's commercial corridor.

07 — THE LOUISIANA AI NETWORK — MARLIE I IS PHASE ONE

WE ARE NOT BUILDING A DATA CENTER. WE ARE BUILDING A NETWORK.

Marlie I is the first node. ADC3K's home base — owned land, owned building, owned permits, zero external dependency. Once it is operational and cash-flowing, it funds everything that comes next. ADC3K has two additional sites in development. Lafayette is the hub. Louisiana is the network. Every infrastructure partner at the table today — LUS Fiber, Atmos Energy, LUS Power, the City of Lafayette — is not a vendor. **They are a node in the same network.** This is how you build a city-scale AI infrastructure business from the ground up.

HOME BASE

PHASE ONE — ACTIVE

MARLIE I

1201 SE EVANGELINE THRUWAY — LAFAYETTE

Home base. ADC3K's owned property — $15K total debt. The proving ground. First Rubin-class AI factory in Louisiana. Establishes cash flow, operational credibility, infrastructure partnerships, and the playbook for every site that follows.

H2 2026
TARGET ONLINE

3×
EXPANSION VECTORS

IN DEVELOPMENT

PHASE TWO — IN DEVELOPMENT

SITE TWO

ADC3K LOUISIANA NETWORK — LOCATION TBD

Funded by Marlie I cash flow. Second node in the Louisiana AI network. The playbook is already written. Infrastructure relationships are already established. Hardware procurement is already understood. ADC3K replicates the model with speed and precision no outside operator can match.

ACTIVATION TRIGGER

Marlie I reaches operational revenue threshold → Site Two capital deploy begins. No external fundraising required at that stage.

IN DEVELOPMENT

PHASE THREE — IN DEVELOPMENT

SITE THREE

ADC3K LOUISIANA NETWORK — LOCATION TBD

Third node completes the Louisiana hub-and-spoke architecture. Combined network capacity reaches enterprise-grade scale. Statewide inference capacity, unified operations team, shared infrastructure contracts. Three sites. One network. One operator.

COMBINED NETWORK TARGET

Three ADC3K sites → statewide AI inference network → enterprise + government + city infrastructure at scale.

A MESSAGE TO LAFAYETTE'S INFRASTRUCTURE PARTNERS

THIS IS NOT A VENDOR RELATIONSHIP. THIS IS A CITY BUILDING ITS FUTURE.

LUS Fiber's reach grows when Marlie I connects. Atmos Energy gains a long-term industrial gas customer that anchors rate stability across its distribution network. LUS Power gains a sophisticated energy partner with on-site generation. Lafayette Regional Airport gains a commercial UAS operator on its doorstep. The City of Lafayette gains Louisiana's first next-generation AI factory — jobs, tax base, and a flagship project that

WHAT EACH PARTNER GAINS

LUS FIBER	Anchor industrial fiber customer. Justification for BEAD-funded backhaul expansion along the SE Evangeline corridor.
ATMOS GAS	Long-term industrial supply contract. High-volume predictable load — the kind of customer that stabilizes rates across the distribution network.
LFT AIRPORT	Active Part 107 commercial UAS operator adjacent to controlled

puts Lafayette ahead of every other city in the state in the AI infrastructure race.

ADC3K is not asking the city for a favor. ADC3K is inviting Lafayette's infrastructure partners to build the city's next chapter with us. Every site we add is another node in Lafayette's economic future.

airspace — inspection, logistics, survey from day one.

CITY / LED

Louisiana's first Rubin-class AI factory. Act 730 qualified. OBBBA compliant. 50+ permanent jobs. Lafayette on the national AI map — first.

FINANCIAL ARCHITECTURE — RETURN ON INVESTMENT

THIS IS NOT A DATA CENTER. THIS IS A MONEY MACHINE.

Legacy data centers were built for the internet era. Air-cooled, energy-wasteful, retrofitted with GPUs they were never designed to hold. Their "renewable energy" is paper REC credits while 40–80% of power burns on chillers. That era is over. MARLIE I is purpose-built for AI — highest density, lowest energy cost, fastest deployment. Every watt generates revenue. Every dollar goes to compute. The comparison is not close.

THE COMPARISON NOBODY WANTS TO MAKE PUBLIC

METRIC	LEGACY DATA CENTER 2010s Air-Cooled Infrastructure	MARLIE I — AI FACTORY Lafayette, Louisiana — 2026
Design Purpose	Internet traffic, email, CDN	AI inference — purpose-built
Power Efficiency (PUE)	1.4 – 1.8 (40–80% wasted)	1.10 (liquid-cooled, best-in-class)
Cooling Method	Air (CRAC units, chillers)	100% direct-to-chip liquid
Energy Cost / kWh	$0.10 – $0.18 (national avg)	$0.065 (Louisiana industrial)
On-Site Generation	None — grid dependent	Bloom Energy fuel cells + gas generators
"Renewable" Claim	REC paper credits — not actual generation	Actual on-site fuel cell generation

> GPU hardware (NVIDIA NVL72) priced separately via NVIDIA Enterprise Sales — available through equipment financing, NVIDIA Capital, and SBA programs. Infrastructure above is bankable as commercial real estate improvement.

ANNUAL OPERATING COST — FULL BUILD (16 RACKS)

Energy (est. 2.4 MW @ $0.065/kWh)	$1,370,000
Same load, national avg $0.122/kWh	$2,570,000
Louisiana Energy Savings / Year	+ **$1,200,000**
Staffing — Mission Control AI (3–5 FTE)	$500,000
Legacy DC staffing same scale (25 FTE)	$3,000,000
AI-Managed Staffing Savings / Year	+ **$2,500,000**
Connectivity & bandwidth	$150,000
Insurance, maintenance, misc.	$300,000
Total Annual OPEX Est.	**~$2.32M**

> Combined advantage vs. equivalent operation nationally: **$3.7M+/year** in energy + staffing savings — before a single dollar of revenue.

REVENUE MODEL — AI COMPUTE RENTAL (CONSERVATIVE BASIS)

How the capital stack works: The ~$1.17M infrastructure raise covers the facility buildout — electrical, cooling, fiber, power distribution, and commissioning. GPU hardware (NVIDIA NVL72 racks) is financed separately via equipment financing, NVIDIA Capital programs, and SBA facilities. EBITDA figures below reflect facility-level operating cash flow. A full investor pro forma with hardware financing and debt service is available upon request.

YEAR 1 — 4 RACKS LIVE · 40% UTIL

$6.1M

Gross annual revenue (Floor 1 ramp)

288 GPUs online (Floor 1 ramp)
@ $6/GPU/hr conservative
40% utilization ramp — 4 racks

NATURAL GAS — THE HENRY HUB ADVANTAGE

Lafayette sits 40 miles from **Henry Hub** — the global gas price benchmark. Bloom Energy fuel cells convert Gulf Coast natural gas at **60%+ efficiency**, generating on-site power at **$0.07–$0.09/kWh** — independent of the grid. Every competitor on grid rates pays a premium that compounds annually. We locked in the cheapest, most reliable power source in the country before the first rack arrives.

AI-MANAGED OPERATIONS — MISSION CONTROL

MARLIE I runs on **Mission Control** — an AI multi-agent platform built in-house managing thermal, load balancing, maintenance, and provisioning in real time. What used to take **20–50 staff** runs with **3–5 people**. Annual staffing savings vs legacy ops: **$2.5M+/year**. Not a future feature — operational today.

TIMELINE — CAPITAL IN, REVENUE OUT

Q1–Q2 2026

Capital & Build

Financing close. Site prep. Electrical upgrade. CDU installation. LUS fiber activation.

Q3 2026

First Racks Live

NVIDIA Vera Rubin NVL72 delivery. Racks 1–4 commissioned. Mission Control online.

Q4 2026

Revenue Begins

First dollar of AI compute revenue. Racks 5–8 commissioned. Bloom Energy fuel cells operational.

2027

Full Phase 1

All 16 racks live. 57.6 ExaFLOPS online. $19–36M+ annual revenue range at target utilization.

2027–2028

Phase 2 & Beyond

2nd floor expansion. Phase 2 site. Louisiana AI Network buildout. Cash flow funds next node.

5-LAYER POWER RESILIENCE — HURRICANE-RATED INFRASTRUCTURE

Lafayette sits 60 miles inland from the Gulf Coast — FEMA Zone X, high ground, dry through Katrina, Rita, and Ida. But we are in Louisiana. We engineer for what *can* happen, not just what usually happens. MARLIE I is designed to keep running through a Category 4 landfall — five independent power layers, stored fuel for 96+ hours on-site, and zero dependence on any single utility or pipeline.

1

LUS POWER — UTILITY GRID TIE

Lafayette Utilities System municipal grid. Primary power during commissioning, servicing windows, and low-draw periods. Cooperative interconnect agreement — municipal utility. MARLIE I draws minimally from

the grid at operating capacity, but the tie-in is the legal and operational safety net required by lenders and by code.

2

BLOOM ENERGY — ON-SITE FUEL CELLS

300 kW continuous (Phase 1), scalable in 300 kW increments. Converts Gulf Coast natural gas at 60%+ electrical efficiency — **$0.07–$0.09/kWh** effective cost, grid-independent. Runs 24/7/365 without interruption. Offsets 10.8% of Phase 1 facility load on an ongoing basis. Made in Newark, Delaware — 100% domestic.

3

CAT G3520H — NATURAL GAS PRIME POWER (PARALLEL N+1)

2× Caterpillar G3520H — 2.5 MW each, **5 MW total installed capacity**. Both units operate in parallel at moderate load, providing true N+1 redundancy across the full build — if either unit requires service, the other carries the facility without interruption. EPA prime/continuous certified — not standby-restricted. 10-second full block load from cold start. Natural gas / up to 25% hydrogen blend. Manufactured: **Caterpillar Large Engine Center, Lafayette, Indiana.** 5,500 parts from 500+ U.S. suppliers across 33 states. OBBBA domestic content certified.

4

UPS — BATTERY RIDE-THROUGH

Uninterruptible power supply — millisecond switchover, seconds-to-minutes battery ride-through during any source transition. Protects compute hardware from power transients. Vertiv (Columbus, Ohio) or Eaton (Menomonee Falls, Wisconsin) — both American manufacturers. Standard Tier III data center requirement. Zero perceived downtime to hosted workloads during any power source switch.

5

DIESEL EMERGENCY BACKUP — HURRICANE LAYER

Last-resort layer — independent of natural gas pipelines, utility grid, and all external infrastructure. Activates when gas supply is interrupted by hurricane, pipeline shutdown, or force majeure.

Phase 1: 1× Cat C175-16 diesel emergency standby — 3,365 kW (3.4 MW). Covers full Phase 1 facility load as a single unit. On-site **30,000-gallon double-wall UL 142 diesel storage tank**. Fuel consumption: ~229 gal/hr at full load. Runtime: **110+ hours** — NFPA 110 Level 1 (96-hour minimum) exceeded.
Full Build: 2× Cat C175-16 diesel (N+1) — 6,730 kW operational with any one unit offline. Covers 6.34 MW full-build requirement. Two 30,000-gallon UL 142 tanks (60,000 gal total). 96-hour runtime at full two-floor load per NFPA 110 Level 1.

Manufactured: **Caterpillar Large Engine Center — Lafayette, Indiana.** C175 family is exclusive to the Lafayette LEC. 10,000th C175 engine rolled off the line December 2023. Same dealer, same service contract as our nat gas units: Ring Power, Louisiana. One relationship covers the entire generator fleet.

5	96h	0
INDEPENDENT POWER LAYERS	ON-SITE DIESEL FUEL	SINGLE POINTS OF FAILURE

Hurricane Protocol: When a Gulf Coast storm threatens, MARLIE I switches to diesel + Bloom Energy island mode, disconnects from the grid, and runs self-contained. Natural gas generators remain on hot standby. Once the

storm passes and pipeline pressure is restored — typically 24–72 hours for Lafayette inland — prime power transitions back to natural gas. Diesel tank is replenished via fuel delivery contract. **Customer-facing downtime: zero.**

WHAT INVESTORS GET — BEYOND THE RETURN

RESERVED BANDWIDTH

Investors receive **reserved GPU compute access during off-peak hours** — proportional to investment tier. Run your own AI workloads, inference jobs, or LLM fine-tuning at no marginal cost. Estimated compute credit value: **$50K–$500K/month** depending on tier. This is not a perk. It is a second revenue stream.

EARLY MOVER RATE LOCK

Investors who commit before the first rack goes live receive **locked GPU rental rates below market for 24 months** on their reserved bandwidth. As Vera Rubin compute demand increases through 2026–2027, the rate gap widens. Early capital = early advantage, compounding monthly.

NETWORK EQUITY

MARLIE I is Phase 1 of the Louisiana AI Network — a multi-site regional infrastructure play. **Early investors in MARLIE I receive preferred participation rights** in Phase 2 and Phase 3 sites. Owning a stake in the first node means owning the template for every node that follows. The network effect is real and it starts here.

WHAT LAFAYETTE WINS — THE COMMUNITY RETURN

50+

PERMANENT LOCAL JOBS

Avg. wage $65–90K — technicians, engineers, operations, security

$45M+

5-YEAR ECONOMIC IMPACT

Direct wages, vendor spend, contractor activity, induced local spending

#1

FIRST RUBIN-CLASS AI FACTORY IN LOUISIANA

Lafayette leads the Gulf Coast before Baton Rouge, New Orleans, or Houston claims it

Act 730

20-YEAR TAX STRUCTURE

Designed to attract and retain the exact type of high-tech industrial investment this project represents

FEDERAL FUNDING THAT FOLLOWS THIS PROJECT INTO LAFAYETTE

CHIPS Act

Domestic AI compute infrastructure. MARLIE I's 100% US hardware supply chain qualifies. ADC3K as anchor tenant strengthens Lafayette's application for EDA Tech Hub designation — which brings federal matching dollars to the region, not just this project.

OBBBA — $500B AI Infrastructure

One Big Beautiful Bill Act directs federal procurement and incentives toward domestic AI infrastructure. MARLIE I was designed from day one to qualify. Every federal contract this project attracts flows through Lafayette's economy.

BEAD Broadband Expansion

MARLIE I as an anchor industrial fiber customer strengthens LUS Fiber's case for BEAD program expansion funding — extending high-speed municipal broadband further into Lafayette Parish. The data center pays; the community benefits.

Other cities are retrofitting 2010s internet infrastructure with band-aid GPU clusters. Lafayette goes straight to the front — purpose-built, liquid-cooled, AI-native, and federally eligible from day one. **Cities that win the infrastructure race in 2026 lead the regional economy for 20 years. This is Lafayette's moment.**

US 100% MADE IN AMERICA

EVERY COMPONENT. EVERY SUPPLIER. EVERY DOLLAR.

NVIDIA GPUs
Manufactured in Texas — Houston & Dallas area facilities. CHIPS Act domestic production. Zero foreign semiconductor dependency.

Bloom Energy Fuel Cells
Assembled in Newark, Delaware. US-manufactured solid oxide fuel cell stacks. American clean energy technology.

Vertiv Cooling Systems
Columbus, Ohio. CDUs and thermal management built in the American heartland.

LUS Fiber Network
Lafayette, Louisiana. City-owned municipal infrastructure. Every fiber mile is local.

Building & Construction
Built by Louisiana General Contractor (ADC3K). Lafayette labor, Louisiana materials, zero foreign GC markup.

Mission Control Platform
Designed and built in Lafayette, Louisiana. Open-source AI operations platform — American software, American infrastructure, American owned.

We are not importing AI infrastructure. We are **building America's AI infrastructure** — American hands, American companies, American capital. 100% OBBBA compliant. Full federal incentive stack qualified. This is what rebuilding American technological leadership looks like.

LUS — THE UTILITY PARTNERSHIP THAT MAKES THIS POSSIBLE

Lafayette Utilities System is not a vendor relationship — it is a strategic co-anchor of this project. LUS Fiber brings the data backbone. LUS Power provides the grid interconnect and commissioning supply. Atmos Energy feeds the gas supply 3 miles out from Henry Hub, the world's most liquid natural gas pricing benchmark. MARLIE I was sited

specifically because Lafayette's utility infrastructure is city-owned, locally governed, and already positioned to support industrial AI compute at a cost no private utility can match.

LUS FIBER — WHAT IT BRINGS

Direct low-latency municipal fiber — 0.8 miles from site. No incumbent telco middleman, no capacity auctions, no foreign-controlled backbone.

Anchor industrial customer status — MARLIE I becomes LUS Fiber's largest single-site industrial customer, strengthening LUS's BEAD program expansion case and backhaul investment justification.

Public-private partnership pathway — A Lafayette-owned utility serving Lafayette-owned AI infrastructure is a story that resonates at the federal funding table. Both parties benefit from telling it together.

LUS POWER — WHAT IT BRINGS

Industrial rate infrastructure — $0.065/kWh industrial rate is one of the lowest in the US Gulf Coast. This rate advantage is baked into every year of the financial model and compounds as the facility scales.

Grid interconnect agreement — Layer 1 of the 5-layer power stack. Required for lender compliance, code compliance, and commissioning operations. The cooperative interconnect structure with LUS is the legal foundation the entire power architecture rests on.

Long-term industrial load growth — As MARLIE I scales to full build and Phase 2 sites come online, LUS Power adds a high-value, high-demand industrial customer that doesn't spike unpredictably — AI compute load is flat, continuous, and forecastable.

ATMOS ENERGY — NATURAL GAS SUPPLY

3 miles from site — Atmos Energy distribution line at 1818 Eraste Landry Rd. Henry Hub 40 miles downstream. The closest major gas benchmark to any AI data center in the United States.

Long-term industrial supply contract — On-site prime power via Cat G3520H generators runs on Atmos supply 24/7/365. MARLIE I becomes a high-volume, long-duration industrial gas customer with rate stabilization incentives for both parties.

RING POWER — LOCAL CATERPILLAR DEALER

One dealer, one service contract, one relationship — Ring Power Louisiana handles commissioning, preventive maintenance, and 24/7 emergency response for both the Cat G3520H natural gas generators and the Cat C175-16 diesel emergency backup. Local service eliminates remote-dispatch delays during storm events.

Louisiana presence — Ring Power understands Gulf Coast storm operations, fuel logistics, and rapid-response generator servicing. This is an infrastructure relationship, not a vendor order.

The Partnership Pitch to Lafayette Utilities: MARLIE I is not asking LUS to subsidize AI infrastructure. It is asking LUS to be the utility backbone for Lafayette's first industrial AI facility — and to share in the story, the federal positioning, and the long-term load growth that follows. Every Rubin-class GPU

cluster that comes online in Lafayette after this one will ask: *who did it first, and who was their utility partner?* **The answer should be LUS.**

WHAT WE ARE ASKING LAFAYETTE'S INFRASTRUCTURE COMMUNITY FOR

This is not a cold pitch. MARLIE I is a Lafayette project built on Lafayette infrastructure by a Lafayette contractor. What we need from the city's infrastructure community is specific, reasonable, and mutually beneficial.

LUS FIBER PARTNERSHIP ASK	**Industrial fiber service agreement — direct from LUS Fiber network to 1201 SE Evangeline Thruway** Redundant fiber path preferred. MARLIE I will be LUS Fiber's highest-bandwidth single-site industrial customer. We want that relationship formalized early so it can be referenced in federal funding applications together.
LUS POWER PARTNERSHIP ASK	**3-phase industrial interconnect agreement and industrial rate classification** MARLIE I needs a formal utility interconnect agreement for lender and code compliance — this is Layer 1 of the 5-layer power stack. We run primarily on on-site natural gas generation, so peak grid draw is modest. The interconnect is the legal and safety foundation, not the primary supply.
CITY OF LAFAYETTE PARTNERSHIP ASK	**Act 730 application support and LED coordination for OBBBA/CHIPS positioning** Act 730 processing, an introduction to Louisiana Economic Development for co-marketing the project at state and federal levels, and a letter of support for federal funding applications. Lafayette's name on this project matters — at the federal table, a city-backed application carries more weight than a developer-only application.
ATMOS ENERGY PARTNERSHIP ASK	**Long-term industrial natural gas supply agreement with rate stabilization** On-site prime generation via Cat G3520H consumes natural gas continuously — this is baseload industrial demand, flat and forecastable, not seasonal spikes. A long-term supply agreement benefits both parties: MARLIE I gets cost certainty, Atmos gets a high-volume anchor customer on a line that was already running.

Lafayette Built This. Let's Run It Together.

MARLIE I is a Lafayette project. The building is Lafayette. The land is Lafayette. The fiber is Lafayette. The power is Lafayette. The general contractor is Lafayette-licensed. The only thing we need now is the city's infrastructure partners to step into their natural role — and build something together that no other Gulf Coast city has yet.

FIRST VERA RUBIN AI FACTORY IN LOUISIANA

100% LAFAYETTE INFRASTRUCTURE

SHOVEL-READY H2 2026

MARLIE I

BUILT FOR THE FUTURE. NAMED FOR FAMILY.

Marlie I is named for **Marlie** — a reminder that what we build outlasts the spreadsheet. Louisiana's first next-generation AI factory is not a speculative bet on unproven technology. It is a calculated, capital-efficient deployment of the world's most advanced AI infrastructure on owned land, with owned permits, owned certifications, and a decade of Louisiana relationships behind it. The federal money is flowing. The hardware is in production. **The site is ready.** The only question is who is at the table when Marlie I goes live.
